My selection: Surgical topics

among presentations from OA1, OA6, OA7, MA01, MA05, MA07

 OA06.03: Sublobar resection is equivalent to Lobectomy for Screen detected Lung Cancer

 OA06.02: VATS vs. Thoracotomy for Non-small Cell Lung Cancer: Oncological Outcome of a randomized Trial (from statistical point of view)

IASLC 19th World Conference on Lung Cancer

September 23–26, 2018 Toronto, Canada

#WCLC2018

The National Lung Screening Trial (NLST)

- ■Results reported in 2011, CMS coverage 2015
- Demonstrated 20% reduction in lung cancer related mortality
- ■CT screening has increased the detection of "very early" (<2cm) NSCLC.
- ■Role of sublobar resection in screen detected cancers not well explored
- ■Still several years away from results of JCOG 0802 and CALGB 140503.

N ENGL J MED 365;5 NEJM.ORG AUGUST 4, 2011

IASLC 19th World Conference on Lung Cancer

September 23–26, 2018 Toronto, Canada

WCLC2018.IASLC.ORG

#WCLC2018

Methods

- Retrospective, unplanned analysis
- •NLST dataset obtained and reviewed for patients who underwent surgical resection for confirmed lung cancer: 1,029 patients (1.9% of NLST cohort)
- •Outcomes of interest:
 - **▶** Proportion of patients undergoing sublobar resection
 - >Overall survival
 - **≻**Cancer-specific survival
- Specifically analyzed within propensity matched cohorts for effect of extent of resection

NLST: Propensity matched analysis of lobectomy vs. SLR (n=126 each)

IASLC 19th World Conference on Lung Cancer

September 23–26, 2018 Toronto, Canada

WCLC2018.IASLC.ORG

#WCLC2018

Conclusion by authors

- •For patients with screen detected lung cancer, the use of SLR decreases perioperative morbidity compared to lobectomy
- •SLR confers equivalent survival to lobectomy in patients with screen detected cancers
- •The use of SLR for screen detected lung cancer should therefore be strongly considered

IASLC 19th World Conference on Lung Cancer

September 23–26, 2018 Toronto, Canada

#WCLC2018

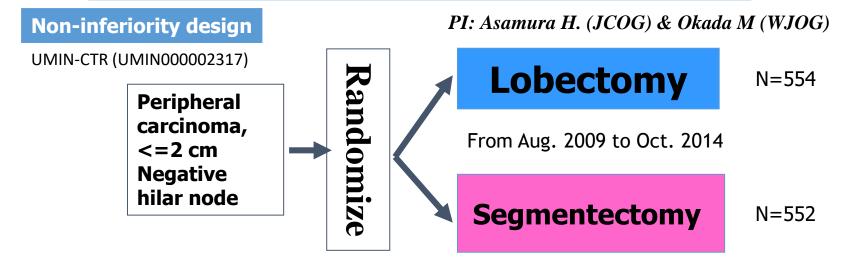

strength

- utilizes large dataset from the NLST
- 5 year f/u available
- 55% stage IA (18% stage IB)
- Propensity matched analysis added

weakness

- retrospective & unplanned analyses
- decision for sublobar resection based on complex interplay of
 - tumor location
 - tumor/consolidation size
 - histological subtype
- JCOG and CALGB trials will address definitively

JCOG0802/WJOG4607L; Phase III Randomized Trial between Lobectomy and Limited Resection for Partsolid GGO – Solid T1a disease

Stratified factors; Institute, Gender, Histology (Ad vs, Non-ad),

Solid or non-solid

Endpoints:

Primary: OS

Secondary: pulmonary function, RFS, safety, etc

Sample size: 1,100

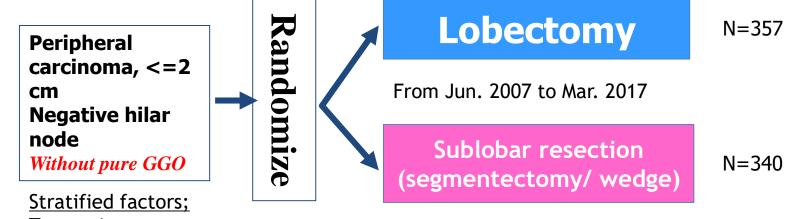

CALGB/ ALLIANCE 140503-Intergroup; Phase III Randomized Trial between Lobectomy and Sublobar Resection for Small-sized carcinoma

Non-inferiority design

PI: Altorki N

Tumor size, Histology, Smoking status

Endpoints Primary: DFS

Secondary: OS, Rate of loco-regional and systemic recurrence, pulmonary function Sample size: 908⇒692

Altorki NK, et al AATS2018

Conclusions in JCOG0802 / CALGB140503 at the moment

- In these large, multicenter trials, there were no significant differences in mortality and morbidity between lobar and sublobar resection in physically and functionally fit patients with clinical T1aN0 NSCLC.
- The low overall 30/90 day mortality and morbidity reflect modern day standards for perioperative outcomes in the surgical treatment of early stage NSCLC.

Methods

- Randomization and masking
- 1. Randomized in a 1:1 ratio into VATS and thoracotomy lobectomy groups
- 2. Neither patients nor any investigators were masked to treatment allocation
- Sample size : >190 cases in each group
- 1. Non-inferiority design
- 2. alpha level=0.05, beta level=0.10, non-inferiority margin = 20%
- 3. for a difference of a 92% 5-year OS of stage IA NSCLC in thoracotomy group versus a 82% in VATS group (from literatures)
- 4. aimed to enroll >400 patients to allow pre/post-randomization exclusions.

This statistical consideration was enough?

- Ex. JCOG0802; Planned sample size is 1,100 One-sided alpha of 5%, power of 80%, non-inferiority margin of 5% assuming 5-year OS of 90%.
- If the authors have assumed equivalent oncologic outcomes between open and VATS derived from retrospective studies, the setting of 10% difference for 5YS was not reasonable. In fact, the authors have selected the non-inferiority design.
- If the non-inferiority margin is set at -20%, HR will be about 4. This means the instantaneous death rate by VATS will four times, compared with open.
- In my idea; if one-sided alpha of 5%, power of 80% and non-inferiority margin of 5% assuming 5-year OS of 92% (HR: 1, Non-inferiority margin: 1.67) are set, total 918 cases will be required.
- It leads to the correct settings are correct conclusion. Investigators must have smooth relations with skillful statisticians.

#WCLC2018

Take Home Message

- ➤ The retrospective study has demonstrated that sublobar resection confers equivalent survival to lobectomy in patients with screen detected cancers. But, definitive decision for this issue should be addressed after concluding the results of both CALGB study and JCOG/WJOG one.
- Although a surgical RCT randomizing between 2 distinctly different operations is very challenging due to patient perceptions (and sometimes physician bias), a prospective RCT should be carried out to observe the manners, especially hypothesis and statistical considerations.
